(1) Search with implied (S) proximity is available in this field.

(2) Numeric search field that may be searched with numeric operators or ranges.

Property Fields⁽¹⁾

In TEMA a numeric search for a specific set of physical properties (/PHP) is available within the text fields (TI, AB, BI). The numeric values are not displayed as single fields but highlighted within the hit displays.

EXPAND in the PHP field (e.g., => E A/PHP) to see all available physical properties. Use EXPAND/PHP to search for all available physical properties. A search with the respective field codes will be carried out in all database fields with English text. The /PHP index contains a complete list of codes and related text for all physical properties available for numeric search.

Field Code	Property	Unit	Symbol	Search Examples
/AOS	Amount of substance	Mol	mol	S 10 /AOS
/BIR	Bit Rate	Bit/Second	bit/s	S 8000-10000/BIR

(1) Exponential format is recommended for the search of particularly high or low values, e.g., 1.8E+7 or 1.8E7 (for 18000000) or 9.2E-8 (for 0.00000092).

DISPLAY and PRINT Formats

Any combination of formats may be used to display or print answers. Multiple codes must be separated by spaces or commas, e.g., D L1 1-5 TI AU. The fields are displayed or printed in the order requested.

Hit term highlighting is available for all fields. Highlighting must be ON during SEARCH to use the HIT, KWIC, and OCC formats.

(1) Custom display only.

(2) SCAN must be specified on the command line, i.e., D SCAN or DISPLAY SCAN

SELECT, ANALYZE, and SORT Fields

The SELECT command is used to create E-numbers containing terms taken from the specified field in an answer set.

The ANALYZE command is used to create an L-number containing terms taken from the specified field in an answer set.

The SORT command is used to rearrange the search results in either alphabetic or numeric order of the specified field(s).

- (1) Hit may be used to restrict extracted terms to terms that match the search expression used to create the answer set, e.g., SEL HIT TI.
- (2) Appends /BI to the terms created by SELECT.
- (3) SELECT or ANALYZE CIT allows you to extract the reference from the source documents in this file and have them automatically converted to a citation format for searching in the SCISEARCH file. SEL or ANALYZE CIT extracts first author, publication year, volume, first page, with a truncation symbol and with /RE appended to the terms created by SELECT.
- (4) SELECT HIT or ANALYZE HIT is not valid with this field.
- (5) Selects ISBN and ISN with /SO appended to the terms created by SELECT.
- (6) Selects ISBN and ISSN with /SO appended to the terms created by SELECT.

 AB For several decades, the electrical resistance spot welding process has
 been widely used in the manufacturing of sheet metal structures,
 especially in automotive bodies. During this period there was no
 significant development for this welding process. However, in recent
 years, in order to meet the demand for lighter, economical, and low-cost
 vehicles, the automotive manufacturing industry is undergoing a
 revolution in the use of high strength steel sheet combinations, chemical
 compositions, and of different thicknesses. In this context, the present
 work focuses on the study and development of a new resistant spot welding
 technology using additive manufacturing (AMSW) in
 zinc-coated steel sheets, used in the automotive industry. As a
 comparison, spot welding was also performed by the conventional
 resistance spot welding process (RSW). The results showed that the spot
 welding process using additive manufacturing (AMSW), through the
 optimized parameters, compared to the conventional resistance spot
 welding process (RSW), was 34.47% higher in relation to the shear
 tensile stress, as well as 28.57% higher tensile stress with a
 perpendicular load to the weld spot. The indentation or thermomechanical
 mark on the surface of the sheet was imperceptible to the visual
 inspection, producing a smooth face in the spot region.
